

# Inherent health and safety benefits

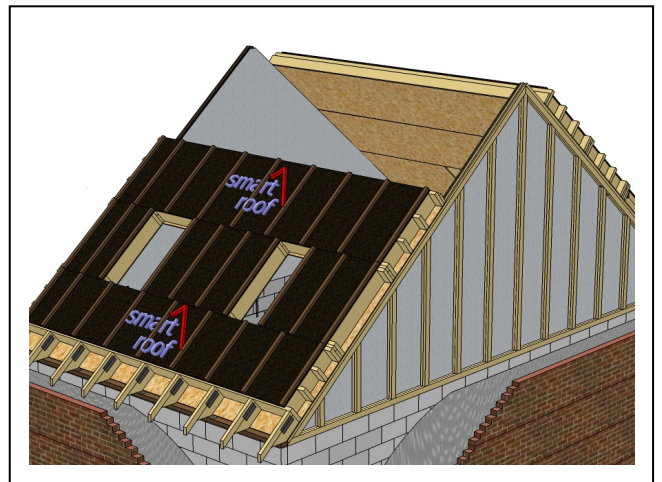

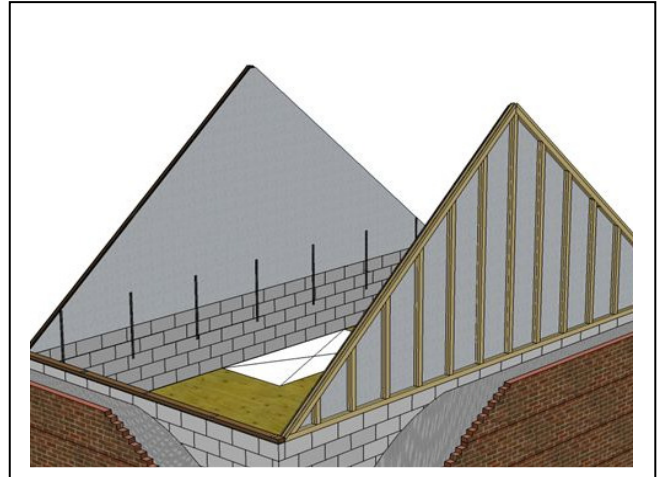

rethinking roof construction

**Recent blockwork gable blow-overs have raised a significant health and safety concern to major house developers. Even with the correct construction methods being followed, and all safety precautions being adhered to, the risk to construction operatives is something that is inherent to the traditional methods of room-in-the-roof construction.**

smartroof Ltd offer an innovative solution to problems created by the use of blockwork gables, steel purlins and top-hat trusses. smartroof's unique gable-to-gable spanning panels eliminate the requirement for steel beams - like no other panelised roof system! In addition to this, with the smartroof® package encompassing prefabricated gable 'spandrel panels', blockwork gables are replaced altogether.

The health and safety benefits of smartroof® are inherent to its design and the ease and speed of its construction greatly reduces the risk associated with the construction of roof structures.

Our health and safety consultants have recently produced generic risk assessments and method statements in order for us to actively support developers and installers. smartroof Ltd also provide full training for installers and operate a registered installers scheme.
